

EPAM'S SCRIPTLESS ENTERPRISE TEST AUTOMATION PLATFORM

INSIDEEDGE xAFT DELIVERS A SEAMLESS, SCRIPTLESS ADVANTAGE

InsideEdge xAFT is a scriptless enterprise test automation platform developed by EPAM that accelerates the process of automating testing on multi-tier applications. Working as a framework to connect technical testing personnel to functional personnel like analysts and strategists, InsideEdge xAFT performs targeted automation against identified tiers, including user interfaces, services, databases, and mobile platforms. With the tiers and test cases easily understood by technical and functional team members, InsideEdge xAFT allows for unprecedented collaboration between the two previously siloed departments.

The framework does not require users to learn an underlying programming language. Instead, InsideEdge xAFT runs on an easy-to-learn, human programming language that automates scripts without writing code. That's the scriptless advantage of working with EPAM and using InsideEdge xAFT!

HOW IT WORKS

With testing no longer a separate and specialized activity, your organization can achieve increased automation coverage in areas ranging from UX to web services. The test automation framework is built on an open-source technology stack, which allows users to create highly maintainable suites and support their interfaces from a single scripting platform. Combine these features with InsideEdge xAFT's scriptless architecture, and you get an all-in-one platform for automating application testing, facilitating browser compatibility, supporting back-end database validations, decreasing time-to-market, and saving on dedicated testing resources.

KEY FEATURES

- Intuitive user interface supports modular, configurable, data-driven, keyword-driven, and object-based testing, which is then automated automatically
- Test design and execution are traceable through user interface
- Various dashboard charts provide users with test design and execution metrics
- Modular design allows for reusable test cases, scripts, and suites
- Detailed test execution reports provide focused analysis of testing
- Reporting screenshots enable users to view current and historical test automation results
- Solution integrates with third-party test management tools, including QMetry and Rally
